

Exercise 4

Convolutional neural network

In your fourth exercise, you are required to implement a CNN model to detect the different types of diseases mentioned in the [paper](#) and the Kaggle link below. (It's not necessary to read the entire paper.)

Finally, upload your Jupyter Notebook (.ipynb) file to the site. Good luck!

It's okay if you don't achieve the correct accuracy, but you should try your best.

DATASET: [COVID CXR Image Dataset](#)

(This dataset consists of posteroanterior (PA) chest X-ray images of Normal, Viral, and COVID-19-affected patients. There are a total of 1,823 CXR images.)
